

(same function as used ~~in~~ earlier)

[a function which takes a standard schema & dataframe(df) - harmonize the dataframe according to the specified schema]

→ If ~~some~~ some columns present in data, which is not present in schema, the function will delete those columns)

→ If some columns present in schema but not present in Dataframe, the function will create new columns of same datatype & fill those with null values)

- Finally append the new data in sink.
